SERVICE MANUAL

SPECIFICATIONS

General	
Frequency coverage	26.565 ~ 27.405MHz
Operating mode	F3E (FM), A3E (AM)
Configuration	40 EU / 40 PL / 80 d / 40 EC / 40 UK+40 CEPT / 27 In
Antenna Impedance	50 Ω
Working temperature	-10°C~+55°C
Frequency Tolerance	Better than 0.002%
Input Voltage	13.2V & 26.4V DC
Grounding Method	Negative ground
Current Drain	Transmitter 13.2V : 2.0A Max.
	26.4V : 1.5A Max.
Receiver	About 300mA(max.) 0.8A (VOL Max.)
Dimensions (W x H x D) With projections	Microphone: 60 x 41 x 82 mm Body: 125 x 180 x 45 mm
Weight	Approx.900g
RECEIVER	
Receiving System	Dual conversion superheterodyne
IF Frequencies	Double Conversion 1st 10.695MHz/ 2nd 455KHz
Sensitivity	112dBm for 20dB SINAD in AM Mode
	116dBm for 20dB SINAD in FM Mode
Audio Output Power	3 watts max @8 Ω
Audio Distortion	Less than 5% @ 1KHz
Image Rejection	70dB
Adjacent Channel Rejection	60dB
Frequency Response	300Hz to 3000Hz
Squelch	Threshold 0,2µV(-120dBm)/Tight 1mV(-47dBm)
TRANSMITTER	
Output Power	FM/AM: 4.0 W
Modulated signal distortion	Inferior to 5%
Frequency Response	300Hz to 3000Hz
Output Impedance	50ohms, Unbalanced
Transmission interference	inferior to 4 nW (- 54 dBm)

CIRCUIT DESCRIPTION

Frequency configuration

The receiver utilizes double conversion. The first IF is 10.695MHz and the second IF is 455kHz. The first local oscillator signal is supplied from the VCO module.

The VCO module in the transmitter generates the necessary frequencies. Fig. 1 shows the frequencies.

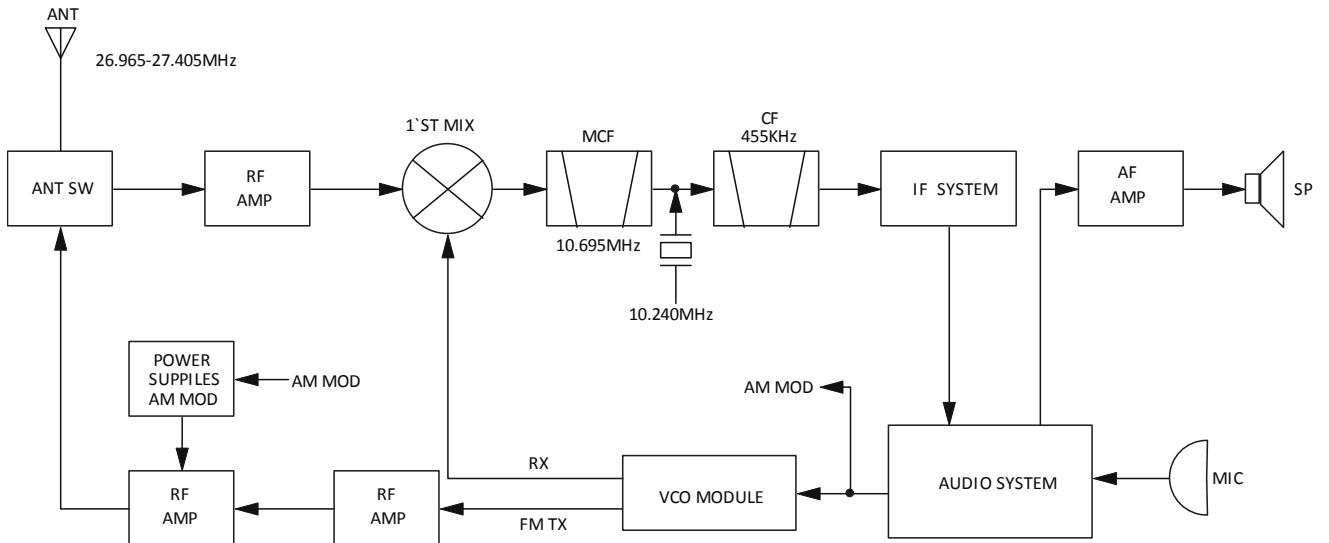

Fig. 1 Frequency configuration

Receiver

The frequency configuration of the receiver is shown in Fig. 2.

■ Front - end RF amplifier

An incoming signal from the antenna is applied to an RF amplifier (Q103) after passing through a transmit/receive switch circuit (D100, D110 and D118 are off). After the signal is filtered through a band pass filter (L103, L104 and L105) to eliminate unwanted signals before it is passed to the first mixer.

■ First Mixer

The signal from the RF amplifier is heterodyned with the first local oscillator signal from the RF module at the first mixer (Q104) to create a 10.695MHz first intermediate frequency (1st IF) signal. The first IF signal through the monolithic crystal filter (MCF : CB100) to further remove spurious signals.

The band-pass filters are tuned to a desired frequency by varicaps (D111, D112, D113). A tuning voltage corresponding to the desired signal is applied to each varicap through the D/A module of the U303A to tune to the receive frequency.

■ IF amplifier

The first IF signal go into second mixer Q113, second mixer mix first IF and 10.24MHz second IF output Y100. The signal is heterodyned again with a second local oscillator signal. The second IF signal is then fed through a 455kHz ceramic filter (CF100) to further eliminate unwanted signals. The signal is amplified by Q114 and Q105, and then the second IF signal enter U101 (FM processing IC) in FM mode or changed according to D117 and receive audio signal output.

CIRCUIT DESCRIPTION

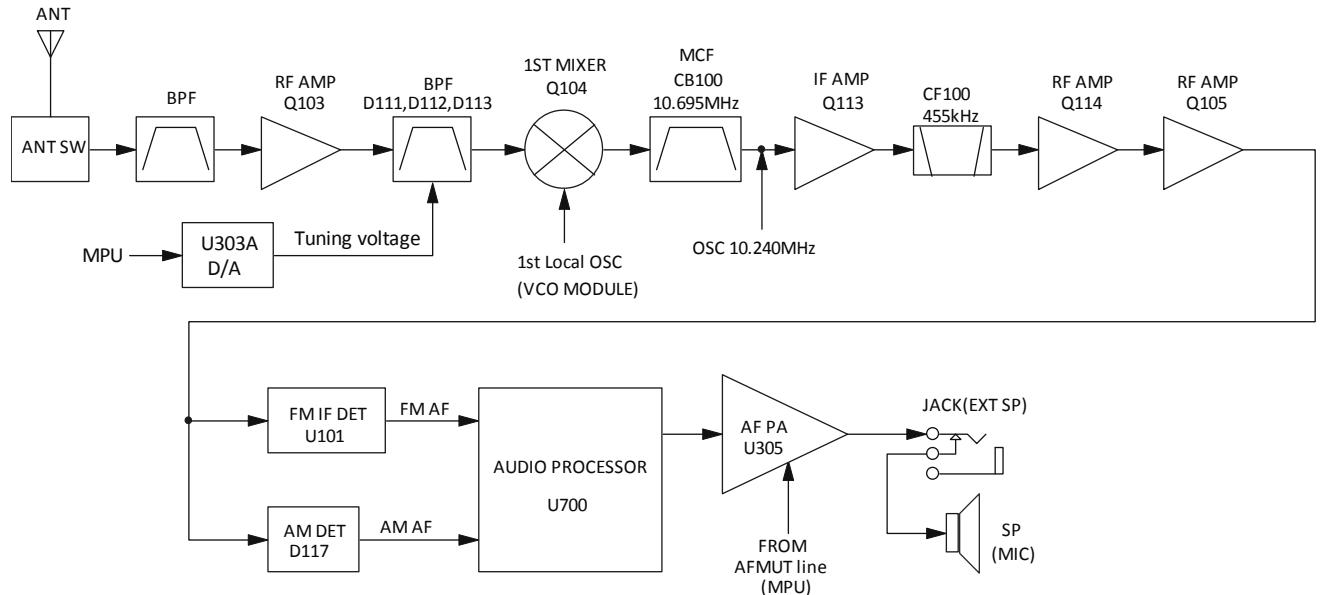

Fig. 2 Receiver section configuration

■ AF amplifier

The FM IC output the FM AF passes through the audio processor (U700) or The AM demodulated signal from Q105 goes to the audio processor (U700) through D117. After goes to AF power amplifier IC (U305). Is routed to an audio power amplifier (U305) where it is amplified and output to the speaker. To output sounds from the speaker, U700 sends a low signal to the SP.MUT line the turns U305.

■ Squelch

A squelch circuit is provided to prevent no-signal noise or weak signals from outputting to a speaker during transmission.

Transmitter

■ Transmit audio

The audio signal from the microphone goes through the audio processor (U4) and resulting signal goes to the VCO module through the RF modulation terminal for direct FM modulation. The AM modulation signal enter into RF amplifier after passing through power supplies Q36, Q37 and Q38.

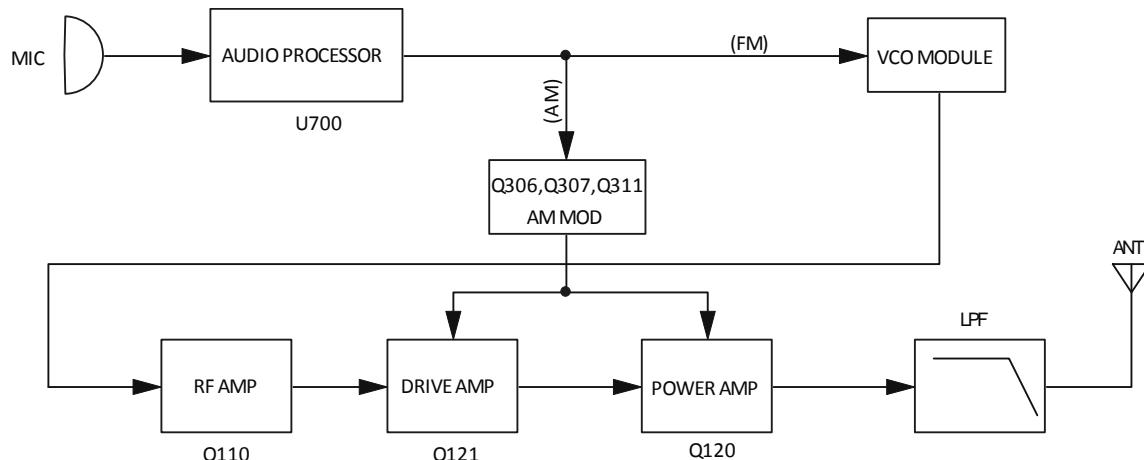

Fig. 5 Transmit circuit

CIRCUIT DESCRIPTION

■ Power Amplifier Circuit

The transmit output signal from the RF module passes through the amplified by Q110 and Q121. The amplified signal goes to the final amplifier (Q120) through a low-pass filter. The lowpass filter removes unwanted high-frequency harmonic components, and the resulting signal is transmitted through the antenna terminal.

Power Supply

The power supply voltage is maintained to 8.0V, 5.0V, and 3.3V by the series regulator (U501, U500, and U503). It is used as 8T and 8R.

8V is a common 8V.

5V is a common 5V.

3.3V supplies power to the VCO module.

8R is 8V for reception and output during reception.

8T is 8V for transmission and output during transmission.

Control Circuit

■ MPU

The control circuit consists of a microprocessor (U700) and its peripheral circuits. It controls the TX-RX unit. U700 mainly performs the following:

- 1) Switching between transmission and reception by the RF signal input.
- 2) Sending frequency program data to the VOC module.
- 3) Controlling squelch on/off by the DC voltage from the squelch circuit.
- 4) Controls the compander unit.
- 5) Controls the power supply unit.

■ Display Circuit

The MPU (U700) controls the display LCD and LEDs. The LCD driver (U800) and MPU (U700) communicate through the DAT, CLK, CS lines. The LEDs driver (U801) and MPU (U700) communicate through the LED lines.

Testing Mode Adjusting Instruction

Note : Testing voltage 13.8V/Equipment HP8921A

Test mode: When radio is off , press and hold the **PTT+ AM/FM + EMG** key and turn on radio, LCD shows “TEST” in 5s, Press **EMG → AM/FM** then full display, enter into the testing mode. Turn the Rotary channel or microphone’s **[UP or DN]** to select menu. Press PTT then turn Rotary channel to adjust parameter.
